Dear Dr. Urbain:

We are writing you today to inform you of our proposal for our final project in the SE 4910 Mobile Application Development course.

We propose the development of a mobile weather application called “Rain?”. This application will use the Dark Sky API to get hyperlocal weather data. It shall have specified ranges of weather conditions and present to the user a prose-like textual description of the current weather conditions. We will also add a homescreen widget so that our users do not need to open the application; they can simply look at their homescreen. In addition, there shall be a button that when clicked will speak the textual weather description to the user.

Regards,

Jordan Longato & Matthew Mahnke

P.S. We have also created a stretch goal for ourselves: when saying “Okay Google, Rain?” this application will open and present the current weather, or something similar.
